Next seminar: Friday 19\textsuperscript{th} November

Large-scale tropical circulations: asymptotic nondivergence?

Jun-Ichi Yano
Meteofrance, Toulouse, France

The tropical atmospheric dynamics are dominated by deep moist convection so we tend to assume that the circulations are also very divergent even in the large-scale limit. The main purpose of the present talk is to point out that it is not quite the case. A simple scale analysis suggests this simple fact, and a data analysis supports this view. Discussions will be developed on its implications.

Seminar will be held in Room 345, Building 28, 12 -1 pm
All Welcome!
